Case Study 4: Advanced Numeric Pattern Generator
Complete Python Source Code

```
size = 5
if size <= 0:
    print("Size must be a positive integer")
else:
    # Upper half, including the widest row
    for row in range(1, size + 1):
        print(" " * (size - row), end="")
        for column in range(1, 2 * row):
            if column == 1 or column == 2 * row - 1:
                print("*", end="")
            else:
                print(" ", end="")
        print()
    # Lower half
    for row in range(size - 1, 0, -1):
        print(" " * (size - row), end="")
        for column in range(1, 2 * row):
            if column == 1 or column == 2 * row - 1:
                print("*", end="")
            else:
                print(" ", end="")
        print()
```
